# Android vs ios reddit 2019

Even though Assistant shortcuts was introduced almost a year ago, there's been absolutely ZERO progress ever since. Google on the other hand made 130B\$ (81% of total revenue) from ad business alone in 2019. The hardware just degrades much faster. There may be some Android phones which have better battery life than iPhones but I'm pretty sure there'd be one day when the battery just dies on you even though you didn't change anything (more about this in the next section). There is immense progress in solving the Android fragmentation issue. I hope Apple opens Shortcuts for 3rd party developers to integrate their apps deeper and makes it much more powerful. I don't understand why people spend premium (>700\$) on an Android! When Android devices are just uploading 40 times more data, it is your resources that are being used to send your data to Google/OEMs for its advantages. It's either Pixel or iPhone. They are let's just say, very basic. No third party has implemented anything yet. IMO, Pixel is the only true Android phone, everything else is just junk. Of course, if Android gets better over time, I'd happily go back and give it a try but till then... Like I said, battery life would be terrible some day and I'd be spending that day with Tasker to find the culprit or find a way to limit usage somehow but all efforts were vain because if some system level apps are to be blamed, you can't do much. When you install an alternative keyboard it shows up in the battery chart usage! (I don't understand why some system Google apps don't show at all). Battery life on Android is not consistent to say the least. But they are just trying to solve an unsolvable problem (it is a side effect of open source OS). Because they are helpful in harvesting more data about users. Here are the main reasons that drove me towards the iPhone. It is a known fact that iOS runs much more efficient than Android. The amount of system level and architectural changes they made at such advanced stages of OS is commendable. So, the purpose why the OSes were created is very clear. I would like to have detailed information about which of the services was causing it which app was responsible for it. Also, if you search 'Google Play Services' on the play store, you can't get to the listing, because they are working for them. On Android, you can add a widget to the home screen. So, you can see although Android is diverse, I have only one option. The CPU, Cellular, WiFi Antennas are just used 40x more. Tasker is basically one main reason why I stick to Android. IMO, Android is very good if you are spending 400\$ (Pixel 4a for e.g) but only till Apple introduces a competitive phone in this price range (iPhone SE is not bad but it is just outdated). But why is it necessary to collect the data when the phone is just sitting there idle? Sorry for the long post. The problem with Tasker is its lack of ability to easily interface with other apps and it doesn't have system level integration. It comes down to how the OSes are designed from the beginning. I was excited because I knew having system level automation would make iOS very powerful. Thanks to iOS finally adopting widgets. Only way afaik is to go to App Info->Google Play Services->App details. The past few Android releases have added nothing significant. If there is something that I don't like I can just get it to work with Tasker. Also, have you noticed how rapidly Gboard and Photos were developed in the recent past. I'd prefer a consistent battery life to a better battery life but inconsistent. This is the backbone of Android OS so much so that even though Android is open source, basically every major app is broken without these services. Hopefully, there won't be any nasty surprises. That's why Android is designed to be open to accommodate faster adoption and it worked. But irony is Google's own system Apps are the biggest abusers. Basically, I want Android phones to be more reliable and consistent in terms of battery life. I have been using Android since 2010 from the Nexus One days. I also have an iPad pro since a couple of years which I was just using like a chrome book. To my surprise, most of the profiles were to optimize battery life like turning off location, BT, WiFi, enabling battery saver etc. Though I'd switch to iOS I'd still use some of Google's services because they are the best. That's why I don't see Android ever getting Shortcuts' equivalent. I have been using Android since the Nexus One days in 2010 and have only been using Nexus/Google play edition/Pixel phones. Ever seen Gboard on your battery usage charts? Yes, I know Tasker, I'm a big fan and have a lot of profiles. Also App drawer or the lack of it, having gazillion apps sitting on your home screen with all that clutter! I wonder how people lived with iOS all through. iOS more closed and Android more open. Android devices upload 40 times more times more data when idle compared to iPhones. Even till the recent times, you had to open the calendar app to see your daily agenda. Yes, there would be some system update which has some bug and causes battery drain but it will be fixed in the following update. There aren't any significant user facing changes where as iOS is just getting better and better. I will be using my iPhone 11 Pro for next few weeks and I will write another post about what I find good/bad. It always has a background process (can be seen in Developer options->Background processes). Android OEMs usually compensate this by just adding huge batteries (30% larger). Why doesn't Google just collect whatever is necessary and upload it when connected to a charger? I don't mind that. I already share my Mail, Photos data, Maps data, Chrome history etc. I'd have expected something like this on Android first. Still, they have the same or worse battery life. I had an iPod touch. They kept on adding features on every update. I hated iOS since the beginning. So, even if you install some ROM you would basically have to get these services for apps to run. As I mentioned above, on one fine day, your phone would die in a day and the Google play services shows up in battery usage, but there is nothing much you can tell what was the actual source of the drain. No matter how much I try to opt out of ad personalization and activity tracking, the battery usage doesn't get better during idle. Personally, I don't mind sharing my data to avail some free services. iPhone with google services is a better combo. Can't add TL;DR because I can't summarize it. First of all, I'm a big Google fan and still am. The features which actually add value to users but have no value to Google's business model get very less attention. Shouldn't Google subsidize all Android phones? When I thought of giving iOS a try, I went through my Tasker profiles to see if I can implement them using shortcuts. I always felt iOS is more suitable for kids and elderly and to get any kind of productive work out of it is not possible. At least I don't have any surprising days. Apple is basically a Hardware company. Thanks to recent changes in iOS 14 like widgets, app library, default apps, SHORTCUTS. Wow, when Apple introduced it in iOS 12? Chances you have never heard of it. And one cannot disable updates for it! It can update whenever it wants. At least, battery life has been very consistent with my iPad Pro. However in recent times both seem to converge. In fact, some of Google's services are the best and there aren't even any paid alternatives that come close. I also don't mind seeing a personalized ad rather than some irrelevant ad for adult diapers. And it is out of my mental ability to understand why people spend 1400\$ on Samsung's crap not so good phones. There is an Android version of Shortcuts called Rules and also Assistant shortcuts. Some other profiles I could replicate using Shortcuts like showing day's agenda and so on. As I'm already used to iPadOS, I know what to expect and what I should compromise. That's where their major revenue comes from. iOS has always been strict with background processes which Android also seems to be doing off late. But even after two years, there is no sign of any equivalent on Android. That's why Android devices degrade faster.

Oct 15, 2019 - Step 3: Turn on Bluetooth on your Android phone. Your Feature phone will show you the list of Bluetooth devices nearby ready to pair. Step 4: Select your Android phone and the transfer will start when the two phones are paired. Step 5: All contacts will now be transferred to your Android phone in the form of Individual VCF Files or VCards. Aug 13, 2021 - 3 Best iOS Emulators for Android. Best Android Xbox Emulators in 2021. But hey, cheer up! ... August 15, 2019 at 5:16 am. just so you know, if you open the Nox Multi-instance-manager you will find that Nox actually has 3 versions of android and that android 5.1.1 is only its default. it can also run android 7.1.2 and android 4.4.2. thought you ... As you can access Liverpool stream with any Android and iOS devices, you can use it to enjoy Reddit Liverpool 2020. Also, this platform offers you HD streams of any Liverpool live game.
